Dear Hiring Manager,

I'm writing to apply for the Product Manager position at your esteemed organisation. Over the past three-plus years, I have been a founding-team Product Manager at an AI healthcare startup, taking clinical AI products from a blank page to live use in hospital ICUs. I want to continue working on products where thoughtful design and careful rollout make a meaningful difference to people.

At Wellytics, I owned the full lifecycle of our AI clinical products: AI Scribe, Clinical Summaries, Discharge Summaries, and Readmission Workflows. Working closely with the founders, I defined the roadmap, wrote PRDs, and translated input from CXOs, clinicians, and hospital operations teams into a prioritized backlog. I led sprint cycles with engineering and data science teams while managing scope, timelines, and release readiness for each feature.

What I am proudest of is getting products adopted, not merely shipped. I led deployments from single-department pilots to multi-ICU rollouts, using structured onboarding and change management to convert pilots into long-term production accounts. I also contributed to pricing, positioning, and go-to-market strategy, and used product-usage data to identify expansion opportunities.

My path into product is unusual, and I believe it is a significant advantage. I hold a B.Tech in Genetic Engineering and began my career with clinical internships in genetic counselling and laboratory operations. I then spent several years at Redcliffe Genetics and LifeCell International, working closely with hospitals, clinicians, and diagnostic centres. I was promoted from BDM to Territory Manager within three years. These experiences gave me a practical understanding of clinical environments, user needs, and the points at which healthcare workflows break down.

Although I moved into product from a non-traditional background, I have consistently earned the trust of stakeholders and delivered at a level that has enabled me to outperform more experienced peers. I believe this combination of clinical exposure, commercial understanding, and hands-on product execution helps me build solutions that healthcare professionals will actually use.

I would welcome the opportunity to discuss how my experience in 0-to-1 AI product delivery, stakeholder management, and healthcare rollouts could contribute to your team. Thank you for your time and consideration.

Sincerely,

Mithil Samudrala
